The combination chamber mixes and burns the two liquids. The reaction passes through the "throat", which aligns all the gases produced in the right direction. Austros leaves the rocket. Several tradefas arise from this selection, some of which include: exchange comparison between popular engine cycles type cycle generator expansion Cycle cycle of pressure the Fed simple advantages; low dry mass; allows high-potency turbocomposes for high specific impulse impulse; Specific impulse of very low complexity; High combustion câmeal pressures allowing simple simple impulse; No turbochors; low dry mass; High Specific Impulse Disadvantages lower specific impulse should use cryogenic fuel; Heat transfer to the fuel limits available for the turbine and therefore the motor impulse has greatly increased the complexity and therefore the mass (more for total flow) limits the pressure of the combustion câm The; Heavy tanks à €
